

FazStore AI Automation System

How the System Works

This end-to-end automation seamlessly bridges manual input and backend e-commerce operations:

- **1. Manual Trigger & Input:** The workflow is initiated through manual execution, feeding raw test data or product requests directly into the system.
- **2. AI-Powered Processing:** The raw input is processed by an **AI Agent (OpenAI)**, which intelligently extracts parameters, intent, and product details (such as name, price, and category) into structured JSON.
- **3. Automated Execution:** Depending on the AI's analysis, the system automatically routes the data and performs backend actions via **Google Sheets** and **WooCommerce** (e.g., creating, updating, or deleting products and logging data seamlessly).

How This Saves Business Hours

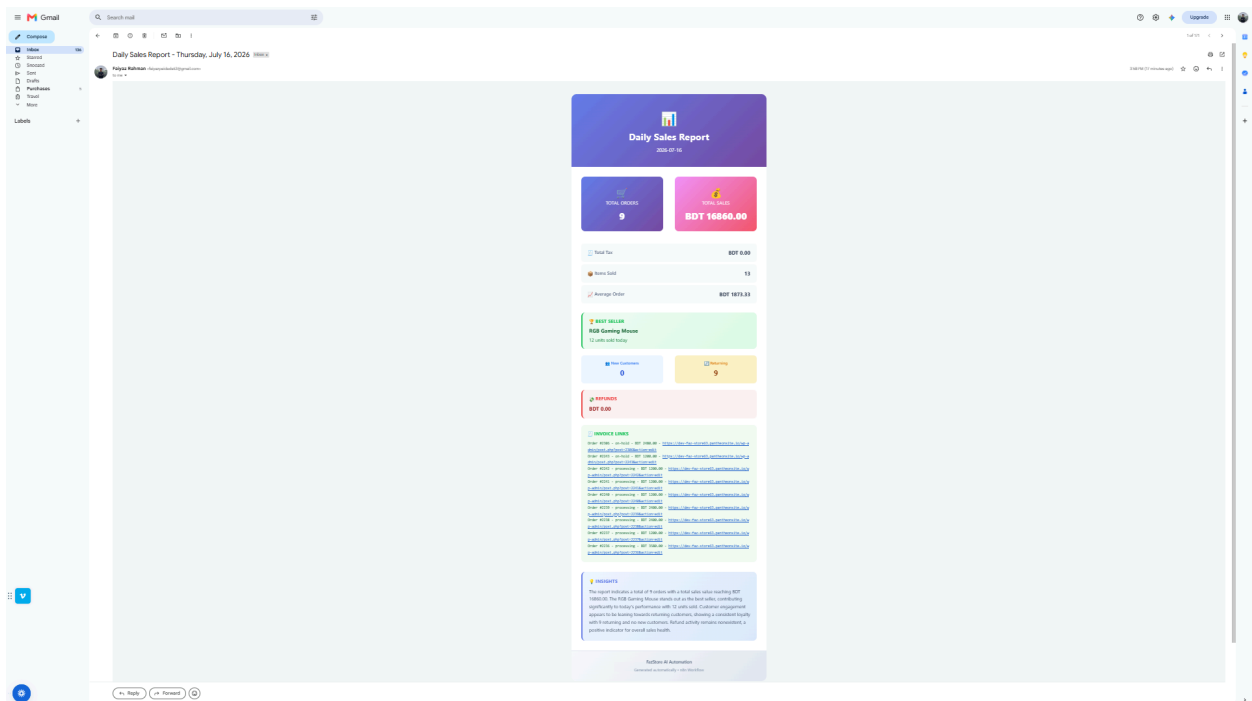

- **Zero Manual Data Entry:** Instead of manually inputting products or sorting data across WordPress and spreadsheets, the AI handles parsing and entry in seconds.
- **Streamlined Operations:** Routine catalog updates and administrative tasks run instantly via automated workflows without requiring manual handling.
- **Saves 15+ Hours Weekly:** By eliminating repetitive operational bottlenecks, business owners can completely shift their focus from manual data work to scaling sales and marketing.
